Data Intake Report

Name: Salary Prediction ML Deployment
Report date: 12 March 2026
Internship Batch:LISUM51:04 NOV 25 -04 FEB 2025
Version:1.0
Data intake by:Julius Kithome
Data intake reviewer:Data Glacier
Data storage location: https://github.com/juliusmuthui015-sketch/Salary-Prediction-ML-Deployment

Tabular data details:

Total number of observations	6
Total number of files	1
Total number of features	2
Base format of the file	.csv
Size of the data	1KB

Proposed Approach

The dataset was validated to ensure there were no duplicate records or missing values.
Basic data quality checks were performed including:
Checking for duplicate rows.
Verifying numeric values for the experience column.
Ensuring the salary column contains numeric values.
Confirming the dataset structure before model training.
Since this is a toy dataset, the validation process was simple and ensured data consistency before building the model.

Assumptions for Data Quality Analysis

The following assumptions were made during the analysis:
The dataset is small and represents a simplified example of salary prediction.
Years of experience is assumed to be the only factor affecting salary.
The salary values increase linearly with experience.
There are no missing values or incorrect data types.
The dataset is clean and ready for model training without extensive preprocessing.
